CASH VALVE TYPE D-53 CONTROL VALVES

A pressure operated diaphragm type control valve designed to control the flow of a fluid or air by an independent pressure applied to the valve diaphragm.

FEATURES

- Available either normally open; closed by diaphragm pressure or normally closed; opened by diaphragm pressure.
- Diaphragm pressure connection can be indexed to over inlet, over outlet or over either side for maximum hook-up flexibility.
- Full port diameter means full capacity and low pressure drop through the valve.
- Larger sizes have a fully balanced inner valve for both inlet and outlet pressures up to 250 psi, ensuring operating pressure requirements unchanged by variations in system pressure.
- Larger size valve component interchangeability enables easy changeover from normally open to normally closed or vice versa.

GENERAL APPLICATION

Suitable for service with water, air, oil or any non-corrosive fluid as a control valve for water cooled air compressors, an air compressor dump valve, an explosive atmosphere valve or as a substitute for expensive electric solenoids.

TECHNICAL DATA

- Materials: Bronze
- Sizes: NPS ½, ¾, 1, 1¼, 1½, 2 (DN 15, 18, 25, 32, 38, 50)
- Connections: Threaded NPTF
- Pressure range: 0 to 250 psig (0 to 17.2 barg)¹
- Max. temperature: 180°F (82°C)

NOTE

1. The maximum diaphragm loading pressure must not exceed 300 psig (20.7 barg).

### CASH VALVE TYPE D-53 CONTROL VALVES

#### CONSTRUCTION/SPECIFICATIONS

The Type D-53 control valve is fitted with a bronze body, renewable 303 stainless steel plated valve seat of full port diameter, a renewable NBR composition seat disc, NBR nylon diaphragm and rust resistant steel bolts.

#### DIAPHRAGM PRESSURE REQUIREMENTS* (to fully open or fully close valve)

<table>

</tr>
</tbody>
</table>

**NOTE**

Diaphragm pressure requirements for 1½" and 2 sizes are 20 psi to fully open a normally closed valve and 20 psi to fully close a normally open valve.

* Open for ½" thru 1¼" sizes.

</tbody>
</table>

* Top connection extends vertically upward on 1" thru 2" body sizes.

** Normally open

** Normally closed

** B" dimension extends to the height of the top connection on 1" thru 2" body sizes.
CASH VALVE TYPE D-53 CONTROL VALVES
CAPACITY INFORMATION

HOW TO FIND WATER CAPACITY

1. Determine the pressure drop (psi) across the valve (inlet pressure minus outlet pressure). On the graph, locate this valve on the pressure drop ordinate.
2. Locate the given gpm capacity on the water flow ordinate.
3. Draw a horizontal line from the pressure drop point and a vertical line from the flow capacity point and mark their intersection. Select the diagonal valve sizing line to the right of this intersection point. Either of the two sizes is the correct valve for the given service conditions. Do not select a valve size to the left of an intersection point.

Example: Given inlet pressure 20 psi, outlet pressure 10 psi, flow 20 gpm.

(1) Pressure drop = 10 psi. Locate this point on the pressure drop ordinate.
(2) Locate the 20 gpm point on the water flow ordinate.
(3) The 10 psi horizontal pressure drop line and the vertical 20 gpm water flow line intersect between the ½"-¾" and 1"-1¼" sizing lines.

The closest valve size to the right of the intersection point is the 1" or 1¼" size. Select either of these two sizes.

(4) Maximum valve capacity = 38 gpm.

NOTES
1. Consult the factory for valve sizing with pressure drops greater than 100 psi.
2. Maximum capacity of a selected valve size is found by drawing a horizontal line from the already determined intersection point to the valve sizing line. From this new point, draw a vertical line down to water flow ordinate. The maximum capacity of the valve is where this vertical line intersects the water flow ordinate.

CAPACITY INFORMATION

HOW TO FIND AIR CAPACITY

1. Determine the pressure drop (psi) across the valve (inlet pressure minus outlet pressure). On the graph, locate this valve on the pressure drop ordinate.
2. Locate the given scfm capacity point on the air flow ordinate.
3. Draw a horizontal line from the pressure drop point and a vertical line from the flow capacity point and mark their intersection. Select the group of curves to the right of the intersection point. The inlet pressure curve must always be to the right of the intersection point. If not, the valve size must be obtained from the next group of inlet pressure curves – to the right of the intersection point.

Example: given inlet pressure 20 psi, outlet pressure 10 psi, flow 200 scfm.

[1] Pressure drop is 10 psi. Locate this point on the pressure drop ordinate.
[2] Locate the flow of 200 scfm on the air flow ordinate.
[3] Mark the point where the 10 psi and 200 scfm lines intersect. Notice the intersection point is to the right of the inlet pressure curve of 20 psi. Therefore, a 1” or 1¼” valve should not be selected. Rather, a 1½” or 2” valve should be chosen from the next group of inlet pressure curves - to the right of the intersection point.

NOTES
1. Consult the factory for valve sizing with pressure drops greater than 100 psi.
2. Inlet pressure curves for pressures other than 10, 25, 50 or 100 psi should be spaced proportionately and drawn parallel to the given higher and lower inlet pressure curves.
3. Maximum valve capacity is found by drawing a horizontal line from the intersection point to the valve size inlet pressure curve. From this new point draw a vertical line down to the air flow ordinate. The maximum capacity of the valve is where this vertical line intersects the air flow ordinate.
